

TEST-GARISSA-01

14 acres (our measurement) · Flood validation

50 / 100 — Poor Best for business use.

We do not recommend this plot for building a home — it scores 35 out of 100 for that. The reasons are below.

The overall figure is the best of the four, not their average. Land is bought for a purpose.

The four things people ask

Can I build a house here?

We can't tell you yet

The soil maps read this ground as ordinary clay, but flat land in this part of Kenya is often black cotton and our data cannot tell the two apart here.

What this means for you

Do not agree a building budget until a soil test is done. Black cotton can add a lot to what the foundation costs.

We can't be sure — see the checklist.

Can I farm it?

Only with water

Rain is low — about 349 mm a year.

What this means for you

You would need a borehole or a dam for anything beyond drought-hardy crops or grazing.

We're fairly confident about this.

Will it flood?

Yes, it floods

A large part of this plot is in the highest flood categories, and so is the land around it.

What this means for you

Expect water here in a heavy season. Ask neighbours how high it came last time — they will know better than any map.

We're fairly confident about this.

Is this area growing?

Yes, steadily

There is real growth in night-time lights, but not at the pace of the fastest peri-urban areas.

What this means for you

Steady area. Buy for what you will use it for, not for a quick rise.

We're fairly confident about this.

What is nearby

On the land itself: main road, tarmac road, secondary school, mobile network mast — these cross the plot rather than sitting near it.

Primary school	5 min walk	394 m away
Clinic	17 min walk	1.3 km away
Hospital	17 min walk	1.3 km away
River (a limit on where you can build, not a convenience)	10 min walk	833 m away

Straight-line distance to the nearest mapped feature, not road distance. Health facilities are recorded at the centre of their ward rather than at the building, so treat those as approximate.

Before you pay

1. Get a soil test. This is the important one.
Ask for a test that says whether the soil is expansive or black cotton. Do it before you agree a building budget.
2. Ask neighbours how high the water came last season
Our flood reading is worked out from the shape of the land. It cannot see a blocked drain or a broken dike.
3. Find out where water will come from
We found no mapped water point close to this plot.
4. Confirm the boundary with a licensed surveyor
Our measurements come from maps, not from beacons on the ground.
5. Have your advocate do an official search at the Lands office
We do not check ownership, charges or disputes. Nothing in this report is a substitute for that search.

How we worked this out, and what this report is not

Everything here is measured from satellite images, terrain, rainfall records and public datasets. Nobody from our team has stood on this land. This is not a valuation and not a legal opinion. It does not confirm who owns the land or where its legal boundary runs. Flood risk is worked out from the shape of the land, not from flood records. It cannot see a broken dike or a blocked drain. Always visit the plot and use an advocate and a licensed surveyor before you pay any money.
